LUMI — Current Progress State

Snapshot taken:

- Local (Asia/Kuching, MYT = UTC+8): **2026-09-29 08:03 Tuesday**
- UTC: **2026-09-29 00:03 Tuesday**

Repository: `Lumina16/MINI-AI-COMPANION-lumi` **Branch:** `arena/01a0ea73-mini-ai-companion-lumi` (branched from `main` @ `717d87c`)

---

1. State of the repository

The project has **no application code yet**. Starting point was a single initial commit containing only a one-line `README.md`.

Files now present:

```
PROGRESS.md <- this file
README.md <- pre-existing, one line
docs/PROGRESS.pdf <- rendered PDF of this progress state
tools/build_pdf.py <- reusable text/Markdown -> PDF generator
```

2. Requested work

Produce a PDF for the LUMI mini-AI-companion project, and record the current progress state in the repository, with date and time.

3. What is done

- [x] Progress state recorded in the repository with local + UTC timestamps.
- [x] PDF **toolchain** installed and verified working.
- [x] Reusable PDF generator written and exercised end to end.
- [x] `docs/PROGRESS.pdf` generated from this file — 2 pages, verified by text extraction.
- [ ] **The actual LUMI deliverable PDF — still blocked.** See §4.

4. Blocker — the source prompt never arrived

The LUMI/Astra prompt was supplied as an attachment **twice**, and **neither attempt reached the sandbox**.

- Declared filename: `LUMI_Astra_Prompt_260929075634.pdf`
- Declared destination: `/home/user/uploads/`

Evidence gathered at snapshot time:

```
$ ls -la /home/user/uploads/
ls: cannot access '/home/user/uploads/': No such file or directory
```

```
$ stat /home/user/uploads
stat: cannot statx '/home/user/uploads': No such file or directory

$ find / -type f -iname "*astra*"
/usr/share/zoneinfo/Europe/Astrakhan <- timezone data, not the file
/usr/share/zoneinfo/right/Europe/Astrakhan <- timezone data, not the file
```

A content search (not a filename search) for the `%PDF-` magic bytes across the filesystem returned no PDF file at all. `/home/user/` contains only `.bash_logout`, `.bashrc`, `.profile`, and the repository checkout.

Because the prompt's content is unavailable, **the deliverable PDF has not been authored.** Its requirements were not guessed at or invented. `docs/PROGRESS.pdf` is the progress-state document, not the LUMI/Astra deliverable.

5. Toolchain — ready and verified

A virtualenv was created (system `pip` is blocked by PEP 668) and the PDF stack installed:

```
reportlab 5.0.1 (generation)
pypdf (verification by text extraction)
```

The generator handles headings, paragraphs, bullets, numbered lists, blockquotes, horizontal rules, fenced code blocks, Markdown tables, and inline bold/italic/code. It stamps every document with MYT and UTC generation times and paginates with a footer.

Two defects were found by running it, and both were fixed:

1. Missing parent directories caused `FileNotFoundError` — now created with `mkdir(parents=True)`.
2. Markdown leaked through as literal asterisk pairs, backquotes and code fences — inline markup

and fenced blocks are now converted, and were confirmed absent from the extracted text.

6. Verification performed

`docs/PROGRESS.pdf` is rebuilt from scratch after every edit to this file, then read back with `pypdf` to confirm real content rather than trusting the byte count. Checks applied:

- Page count and extracted character count are non-trivial (text is genuinely laid out).
- Document title metadata is set.
- Expected prose, timestamps and evidence strings are present in the extracted text.
- No unconverted inline markup survives outside intentional code samples.
- File header is `%PDF-1.4` and trailer ends `startxref` then `%%EOF`.

Note on self-reference: byte size and SHA-256 of this PDF are deliberately **not** recorded here, because the PDF embeds this file and would invalidate them on every rebuild. They are recorded in the commit message instead.

7. Next step to unblock

The attachment path is not working, so use one of these instead:

1. **Paste the prompt text directly into chat** — most reliable.

2. **Commit it to the repo** and tell me the path; I will `git pull`.
3. **Provide a public URL**; I will fetch it.

On receipt:

1. Extract the required scope from the prompt.
2. Write the content to a source file and run `tools/build_pdf.py <source> <output.pdf>`.
3. Verify by text extraction, then update this file and re-stamp.

8. Change log

Timestamp (MYT / UTC+8)	Timestamp (UTC)	Change
2026-09-29 07:58	2026-09-28 23:58	Created `PROGRESS.md`; PDF blocked on missing attachment (attempt 1).
2026-09-29 08:03	2026-09-29 00:03	Second attachment attempt also failed. Installed toolchain, wrote and debugged `tools/build_pdf.py`, generated and verified `docs/PROGRESS.pdf`.
